

/usr/sbin/apachectl: Permission denied

the solution without nesting:

- <https://stackoverflow.com/questions/55728957/apache-failed-at-step-namespace>
- <https://help.directadmin.com/item.php?id=614>

```
$ sudo sed -i -e 's,PrivateTmp=true,PrivateTmp=false\nNoNewPrivileges=yes,g' /lib/systemd/system/apache2.service
$ sudo systemctl daemon-reload
$ sudo systemctl start apache2.service
$ sudo systemctl status apache2.service
```

Oder wie man es richtig mit systemd macht but direct editing of service configuration file is not so beautiful. It's better to edit it by `systemctl edit apache2` command or create override config:

```
$ sudo cat << EOF >> /etc/systemd/system/apache2.service.d/override.conf
# /lib/systemd/system/apache2.service
[Service]
PrivateTmp=false
NoNewPrivileges=yes
EOF

sudo systemctl daemon-reload
sudo systemctl start apache2.service
```
